Appendix A: Replication of Data Consolidation

Instructions for replicating the the process of data organization we followed.

- Obtain the relevant files from the census: four (4) "fin_data" files from 2008 – 2011, and one (1) "IndFin_1967-2007.zip" file.
  - (Contact information is available from: http://www.census.gov/govs/local/)
- Extract these files to a directory on your computer
- Make sure that you have at least 20GB of space available on the drive where your SAS work directory is located, since the data files stored in memory get very large during this process.
- Paste the code from appendix C into a SAS program file.
- Change the directories referenced in the code so that they will work on your machine. There are several locations for these:
  - Line 4
    - Make sure to include the final "/IndFin0" after the file path pointing to the 1967-2007 folder.
  - Line 46
    - Make sure to include the final "/IndFin" (different from above) after the file path pointing to the 1967-2007 folder.
  - Line 114
    - This should point to the data file containing the 2011 data, the text "2011FinEstDAT_ALL5modp_pu.txt" fits the current census data, but these naming conventions change regularly.
  - Line 142
    - This should point to the file containing the 2011 government ID information
  - Line 168
    - Points to the 2010 financial data text file.
  - Line 196
    - Points to the 2010 government ID file.
  - Line 222
    - Points to the 2009 financial data text file.
  - Line 250
    - Points to the 2009 government ID file.
  - Line 276
    - Points to the 2008 financial data text file.
  - Line 304
    - Points to the 2008 government ID file.
  - Line 1189
    - This points to the location and file name where the final comma separated data file should be exported and saved.
- Run the SAS program, it should output a csv file with the consolidated data to the location you indicated on line 1189.

Appendix B: Mapping Natural Language Variables to Census Data Codes

In table A1 we display the census codes used to create each of the database variables, or present a formula in cases where the variable is computed from other database variables. Variables listed as "." Do not have a data code in the newest census data and will not have complete coverage in the database as a result. IGR stands for "intergovernmental revenue", NEC stands for "not elsewhere classified", LTD stands for "long term debt", FFC stands for "full faith and credit", and NG stands for "not guaranteed".

TABLE A1
Corresponding Census Codes or Formulas for Each Database Variable

Database Variable Name	Census Data Codes or Formula

Appendix C: Sas Code for Data Consolidation

The following is the complete SAS code we used to consolidate all of the files we received from the census. Please refer to appendix A for step by step instructions for using this SAS code.

```sas
* This sas macro merges the historical data files that the census provides;
%macro census;
* Defines the text that is repeated in each census file. Base text should be
changed to your correct file path (it is declared twice in the code, so
change both);
%LET BaseText = E:/CensusData/IndFin/IndFin0;
%LET EndTextA = a.Txt;
%LET EndTextB = b.Txt;
%LET EndTextC = c.Txt;
%do i = 7 %to 0 %by -1;
      * Import the data from each of the three physical files in the current
year;
      %Let FileName = &BaseText&i&EndTextA; *Creates concatenated file names
following the census naming conventions;
      proc import datafile="&FileName" out=DataA dbms=dlm replace;
            delimiter=",";
            getnames=yes;
            GUESSINGROWS=700; *This takes longer to run than is optimal, but
will help to ensure that the data types created by proc import are correct.;
      run;
      %Let FileName = &BaseText&i&EndTextB;
      proc import datafile="&FileName" out=DataB dbms=dlm replace;
         delimiter=",";
         getnames=yes;
      run;
      %Let FileName = &BaseText&i&EndTextC;
      proc import datafile="&FileName" out=DataC dbms=dlm replace;
         delimiter=",";
         getnames=yes;
      run;
      * Merge the three data items into one;
      Data LatestData;
            Merge DataA DataB DataC;
            by ID;
      run;
      * The if then else structure allows the larger data set to be created
for the first set of files;
      %if &i = 7 %then
            %do;
            * Add trailing zeros to the ID number to match the format in more
recent data;
            Data LargeData;
            set LatestData;
            run;
            %end;
      %else
            %do;
            * Append the most recently merged data to the larger data file;
            PROC APPEND BASE= LargeData DATA= LatestData force;
            RUN;
      %end;
```

```sas
	%end;
%LET BaseText = E:/CensusData/IndFin/IndFin; * Make sure to change this
destination to match your file system;
%do i = 70 %to 99;
* Import the data from each of the three physical files in the current year;
	%Let FileName = &BaseText&i&EndTextA; *Creates concatenated file names
following the census naming conventions;
		proc import datafile="&FileName" out=DataA dbms=dlm replace;
			delimiter=",";
			getnames=yes;
			GUESSINGROWS=700;
		run;
	%Let FileName = &BaseText&i&EndTextB;
	proc import datafile="&FileName" out=DataB dbms=dlm replace;
		delimiter=",";
		getnames=yes;
	run;
	%Let FileName = &BaseText&i&EndTextC;
	proc import datafile="&FileName" out=DataC dbms=dlm replace;
		delimiter=",";
		getnames=yes;
	run;
	* Merge the three data items into one;
	Data LatestData;
		Merge DataA DataB DataC;
		by ID;
	run;
	* Append the most recently merged data to the larger data file;
	PROC APPEND BASE= LargeData DATA= LatestData force;
	RUN;
%end;
%do i = 67 %to 67;
* Import the data from each of the three physical files in the current year;
	%Let FileName = &BaseText&i&EndTextA; *Creates concatenated file names
following the census naming conventions;
		proc import datafile="&FileName" out=DataA dbms=dlm replace;
			delimiter=",";
			getnames=yes;
			GUESSINGROWS=700;
		run;
	%Let FileName = &BaseText&i&EndTextB;
	proc import datafile="&FileName" out=DataB dbms=dlm replace;
		delimiter=",";
		getnames=yes;
	run;
	%Let FileName = &BaseText&i&EndTextC;
	proc import datafile="&FileName" out=DataC dbms=dlm replace;
		delimiter=",";
		getnames=yes;
	run;
	* Merge the three data items into one;
	Data LatestData;
		Merge DataA DataB DataC;
		by ID;
	run;
	* Append the most recently merged data to the larger data file;
	PROC APPEND BASE= LargeData DATA= LatestData force;
```

```sas
      RUN;
%end;

%MEND Census;

* This line runs the macro shown above;
%Census;

*Create variables not existing in earlier data that can be calculated from
it;
Data LargeData;
      Set LargeData;
      *Manipulate certain identification variables that can be improved in
the overall database;
      FunctionCode = .;
      Enrollment = .;
      if Type_Code = '4' then
            do;
            FunctionCode = Population;
            Population = .;
            Enrollment = .;
            end;
      if Type_Code = '5' then
            do;
            FunctionCode = .;
            Enrollment = Population;
            Population = .;
            end;
      run;

* We now need to format the newer census data to roughly match the format of
the earlier data.  This process is;
* accomplished without a macro because there are only a few years of newer
data, and the file names thend to be non-standard;
* Make sure that you change the "Inflie" line on each of the data steps to
the path for the files on your system.

* Read the financial data file in fixed width format, dollar signs indicate
values which are stored as characters;
DATA FinancialData;
      INFILE 'E:/CensusData/2011/2011FinEstDAT_ALL5modp_pu.txt'
      MISSOVER;
      INPUT id_state $ 1-2 id_type $ 3 id_county $ 4-6 id_unit $ 7-9 id_add $
10-14 itemcode $ 15-17 data 18-29 year 30-33 code $ 34;
      id = cats(of id_state id_type id_county id_unit);
RUN;

* Transpose the financial information file so that every government ID number
corresponds to one row and every data item has its own column;
PROC TRANSPOSE data=work.FinancialData
                     out=work.TransposedData
                     name=Year;
             var data;
             by id;
             id itemcode;
      run;
```

```sas
* Change the "year" variable in the finacnial data matrix to be the year we
are currently working with;
